

# What is the role of Angular core module?

I read an [article](#) about organizing folders in Angular and the author uses one called `core`, in which he creates the core module and insert only services which will be called once.

1

Currently, I'm working on a project whereupon I adopted the structure recommended by the [article](#). Inside my `core` folder/module I created a module called `api`:

3

```
\app
  \core
    \api
    ...
  \shared
  ...
```

My question is: as the `api` is a module, I was wondering why not remove it from `core` and put in `app` folder?

```
\app
  \api
  \core
  \shared
  ...
```

Angular itself has `core` module too (where we import `ngModule`, `Injectable` ...) and I'd like to know what is its role.

- 1 Thank you @Sajeetharan. The article you linked was written, "The clearest and most important use of the CoreModule is the place to put your global/HTTP services." So my api module should be inside core module. – [Pedro Arantes](#) Mar 3 '18 at 15:06
