Bootstrap is an HTML, CSS and JavaScript framework that helps you create web components very easily. ng-Bootstrap is an Angular framework that has angular directives based on Bootstrap. Simply put, it combines the power of Angular and Bootstrap and will let you include Bootstrap components into your angular project easily.

If you are creating a plain website without using angular that time you use bootstrap.

If you are creating a web site in Angular framework that time you use the ng-bootstrap. for using the the ng-bootstrap you should know the bootstrap framework then you can easily understand the ng -bootstrap.

May this help full!!
