

How to rename angular 6 project name?

Asked 8 months ago Active 8 months ago Viewed 3k times

How to rename Angular 6 project name, please?

1 When I do a search for the project name, it has 16 results in 6 files. If I just renamed will it all work fine?

Or do I need to create a new project with the new name and then move the files?

The screenshot shows the VS Code search interface. The search bar at the top contains 'public-register-client'. Below the search bar, it says '16 results in 6 files'. The results are listed in a tree view. The first result is 'angular.json' in the 'public-register-client' directory, with 9 matches. The second result is 'app.e2e-spec.ts' in the 'public-register-client\src' directory, with 1 match. The third result is 'package-lock.json' in the 'public-register-client' directory, with 1 match. The 'angular.json' file content is shown, with several instances of 'public-register-client' highlighted in orange. The 'app.e2e-spec.ts' file content is also shown, with 'public-register-client!' highlighted in orange. The 'package-lock.json' file content is not visible.

```
SEARCH

public-register-client
16 results in 6 files

angular.json public-register-client 9
  "public-register-client": {
  "outputPath": "dist/public-register-client",
  "browserTarget": "public-register-client:build"
  "browserTarget": "public-register-client:build:production"
  "browserTarget": "public-register-client:build"
  "public-register-client-e2e": {
  "devServerTarget": "public-register-client:serve"
  "devServerTarget": "public-register-client:serve:production"
  "defaultProject": "public-register-client"

app.e2e-spec.ts public-register-client\src 1
  getParagraphText().toEqual("Welcome to public-register-client!");

package-lock.json public-register-client 1

As per my screenshot in the original question, I did search & replace the old project name with the new name, in all those 16 results from 6 files.

And I renamed the project folder name with the new name. It works as expected so far

I was trying to install pwa feature to an angular 6 app, and did not create/update the expected files. Turned out the base app name was a different one than the intended one (it was a cloned repo that had the root folder renamed), and doing a name replace fixed it. – [j4v1](#) Feb 6 at 1:08
