

Generate a routing module while creating a module in angular-cli

I recently started implementing lazy loading in my application. I was wondering whether there is any way to create a routing.module.ts while generating a new module in angular-cli application other than creating it manually?

I was searching about this a bit and found some article which has a very good explanation for different kind of commands.

[The Ultimate Angular CLI Reference](#)

So basically, there's no separate command to create routing.module file. But, that can be created while on the creation of the module

ng g module [module-name] --routing will create the module and add the mappings/metadata linkings.
