what's the difference between HttpModule and HttpClientModule in Angular2?

I am new in Angular2 and I am learning to make http calls.

I have found Angular2 has these two modules:

> HttpModule from @angular/http

and

> HttpClientModule from @angular/common/http

and they both support http calls.

However I don't figure out the difference between them.

Does anyone know about this?

| angular | http |

1 Answer

Since their usage is very similar for basic tasks I would advise using HttpClient since it is the more modern and easy to use alternative.

I replaced my `Http` with the newer `HttpClient` . Thanks. — typelogic Feb 4 '18 at 9:32
