How to properly upgrade from bootstrap 3.3.7 to 4.0 on an Angular 6 project

I am developing my first Angular 6 project and, first, I installed Bootstrap 3.3.7 (via npm)

0

Now I have seen here some carousels and things that I would like to implement on my project but BS 4.0 is needed.

How should I do the upgrade in a safe way? I tried myself but I must have broken something because project stopped compiling. I restored the backup and I would like to do it right now.

Thanks

bootstrap-4   upgrade   angular6

1 Answer

Following steps can help you.

4

1. Find a file in your project root directory named **package.json**.

2. In that file go to **dependencies** object. Find `"bootstrap":"^3.3.7"` .

3. Modify that entry to `"bootstrap":"^4.0.0"` .

4. Run `npm install` in your project root directory.

The above steps successfully install **bootstrap-4** in your node_modules.

```
"styles":[
    "./node_modules/bootstrap/dist/css/bootstrap.min.css"
]
```

To import bootstrap .js files go to **scripts** array in your **angular.json** and import as below:

```
"scripts":[
    "./node_modules/bootstrap/dist/js/bootstrap.min.js",
]
```

Now compile your code with **ng build** or **ng serve**. It will work smoothly. Let me know if it throws any error.
